Job Application for Bioinformatic Analyst @ GenomeScan

Dear Vivienne Heemskerk

About Me

I moved from Bochum in Germany to the Netherlands just after my civil service duty to study medical biology in Nijmegen. After finishing my bachelor studies I started my masters in medical biology. For financial and personal reasons, I could not finish my master studies with diploma. However, I finished the mandatory 2 internships and the bulk of the courses. I started working in logistics to finance myself and my studies. What should be a temporary solution to my financial situation turned out to be detrimental to the remainder of my study and a longer endeavor - lasting 4 years. Although having a lot of really nice colleagues and superiors, which value me as a person and employee, I need changes in my life. I want to work in a field that I am deeply interested in and which is more meaningful to me.

Why GenomeScan?

I saw your "Bioinformatics Analyst" position on the glassdoor recruiting platform and could immediately identify myself with this job. General interest in biology and tech, the pandemic and the incurable cancer my dad recently succumbed to, motivates me to apply for this job and to hopefully play a role in cutting edge research and diagnostics at GenomeScan. I want to learn all the ins and outs of the latest ngs technologies, data analysis and data processing pipelines from professionals. Furthermore, I'd like to be involved in the analysis omics data and the development of software enabling your company to deliver reliable, reproducible and meaningful results to your customers and for your research projects. Given GenomeScan's ISO certificates, received fundinigs and research projects it is involved in, I have no doubt I am at the right place.

Why Me?

I believe I am the right person for this job, because I have proven technical and cognitive skills to learn, perform and analyze omics data as can be seen from my internship reports. I have experience in communicating bioinformatical methods to researchers with no bioinformatic background. Given my autodidacticism, my IT and data science skills are predominately self-tought which I am particularly proud of. I don't like idling and usually are actively looking for work or to learn something new.

Sincerely,

Jonas Falck
